

The Defense Health Research Consortium

May 13, 2026

The Honorable Ken Calvert
Chair
Subcommittee on Defense
Committee on Appropriations
H-405 Capitol Building
Washington, DC 20515

The Honorable Betty McCollum
Ranking Member
Subcommittee on Defense
Committee on Appropriations
1016 Longworth House Office Building
Washington, DC 20515

Dear Chair Calvert and Ranking Member McCollum:

As you begin work on the Fiscal Year (FY) 2027 Defense Appropriations Act, we thank you for your continued support of the critical and highly successful Congressionally Directed Medical Research Programs (CDMRP) at the Department of Defense (DoD). The CDMRP plays a vital role in advancing research that protects the health and readiness of our Armed Forces, military families, and veterans, while also benefiting civilian populations.

For FY 2027, we urge you to increase funding for these critical programs above FY 2024 levels by at least five percent plus inflation, to approximately \$1.62 billion. This investment is essential to ensure our nation is prepared to meet current and future public health-related threats and challenges to our national security. An increase in funding is particularly vital to mitigate the impact of inflation on the purchasing power of individual CDMRP programs, as well as the 57 percent reduction in spending for these programs resulting from the enactment of the Full-Year Continuing Appropriations and Extensions Act (Public Law 119-4).

We appreciate your bipartisan efforts to fund CDMRP at \$1.27 billion in FY 2026. However, this level remains well below the \$1.51 billion funding level for CDMRP enacted in FY 2024. Without full restoration and growth, these programs will experience research interruptions that could have long-term implications for the health and readiness of our warfighters.

The highly innovative research portfolio supported by the CDMRP fuels scientific discovery by funding high-impact research not typically sponsored by the National Institutes of Health (NIH), the Department of Veterans Affairs (VA) or other federal agencies. Many of the programs' unique award mechanisms are specifically designed to propel the exploration of revolutionary ideas and concepts. These programs prioritize research with the potential to deliver significant impact —both within their respective scientific fields of research and the health and well-being of the men and women in the U.S. Armed Services. CDMRP grants study a range of conditions, including cancers, respiratory diseases, neurodegenerative disorders, and other toxic exposure outcomes, added as the result of the PACT Act as VA benefit presumptive service-connected health conditions. Defense health research programs are worthy of continued federal support for the following reasons:

- Directly relevant to DoD-prevalent conditions: As the enclosed white paper demonstrates, the medical research programs at DoD directly impact and are aimed at improving the health and lives of current and former members of the U.S. military, their families, and the public. Programs provide groundbreaking research on traumatic brain injury and psychological health, toxic exposures including Gulf War Illness and burn pits, respiratory health, spinal cord injury, hearing and vision loss, and newer conditions such as Long COVID. Research also focuses on existing and emerging infectious diseases that may threaten operational readiness and health security, and why diseases like ALS, multiple sclerosis and Parkinson's disease occur at greater rates in those who have served in the military. CDMRP has also funded orthopedic research that has resulted in new limb-sparing techniques to save and restore functions of injured extremities, as well as outcomes research benefiting injured warfighters in need of orthotic and prosthetic devices.

Equally important, this disease-specific approach includes important medical research programs related to several forms of cancer (breast, pancreatic, kidney, blood, colorectal, bladder, brain tumors, lung, ovarian, prostate, stomach, liver, esophageal, melanoma, rare and childhood cancers), autoimmune diseases and other disorders (like neurofibromatosis and tuberous sclerosis complex) that have led to breakthroughs on nerve regeneration, traumatic brain injury (TBI) and post-traumatic stress disorder (PTSD).

- Complementary – and not duplicative – of other federal research: Defense health research program grants neither duplicate nor supplant NIH or VA research efforts, but rather enhance those efforts. They fund highly innovative projects – support that is typically unavailable through other federal programs. For example, programmatically-related VA research funding is only available to VA employees (at least 0.625 full-time equivalent). CDMRP funds the best-qualified proposals from researchers and research teams at top research universities and medical centers. The NIH and DoD medical research portfolios have symbiotic relationships, allowing NIH-funded basic research to serve as a foundation for ground-breaking, disorder-targeted research at DoD. NIH and DoD program officers meet regularly to ensure collaboration and prevent duplication.
- Cutting-edge and focused on cures: While the NIH funds high-quality basic biomedical research, the defense health research programs provide essential emphasis on and support for finding innovative cures or new therapies for medical conditions. For several disorders, DoD breakthroughs have led to new clinical trials, new drug products, and novel procedures that are making a difference in the everyday lives of affected patients and families. For example, research funded by DoD led to the development of two treatments for tuberous sclerosis complex approved by Food and Drug Administration. The ALS Research Program is supporting translational research and has developed four

potential treatments for the disease, for which an effective treatment currently does not exist. The CDRMP's impact is undeniable: 61 FDA-treatments including 16 cancer drugs, a rapid blood test to detect traumatic brain injuries and more than 600 clinical trials for cutting-edge drugs and vaccines.

- Agile, adaptable, and collaborative: Each of the separate programs is guided by a specific vision and mission statement, which in addition to incorporating Congressional direction, reflects rapid change in knowledge, addresses research gaps, and prevents duplication. Annual funding prevents out-year budget commitments, which in turn further enhances programmatic flexibility. Many DoD programs identify, develop and fund collaborative and consortium-based research, helping to bring unique, interdisciplinary, inter-institutional, collaborative efforts to bear on complex medical research issues unlikely to be solved though the inherent limits of individual researchers.
- Competitive and unique peer review process: While Congress allocates funding through the annual Defense Appropriations Act to specific medical conditions, it does not direct the programs' dollars to specific researchers. These programs utilize an efficient multi-tiered process that includes multiple stages of peer review, including two levels of formal peer review of final proposals. Proposals are scored in a number of key areas such as scientific merit and impact for patients and the military, providing a robust comparative basis for helping accomplish the program's mission of finding and funding the best research related to these important medical conditions.
- Consumer review: All CDMRP programs incorporate the full and equal participation of consumer reviewers at every stage of the multi-tiered review process – a novel and valuable practice in medical research funding. Consumers – people actually affected by the disease or medical condition – help ensure the program's funded research will have the greatest impact on those who are affected. Consumer reviewers also help inform and educate their disease advocacy communities and others.
- Generating economic growth across the United States: Research activities promote job growth and encourage long-term economic development through innovation. It has been estimated that for every dollar awarded in biomedical research grants, more than two dollars of additional business activity is created. Defense health research grants are awarded to researchers in every state in the country.

In short, CDMRP represents a model of effective and efficient stewardship of taxpayer dollars, delivering meaningful benefits to active-duty servicemembers, veterans, the broader patient population, and the nation's economy. Perhaps most importantly, DoD's innovative approach to funding biomedical research has led to several significant breakthroughs and achievements, contributing to national security and the health and welfare of U.S. Armed Forces personnel and their families. Continued federal funding will only build on these successes.

Letter to Chair Calvert and Ranking Member McCollum
May 13, 2026

Lastly, we encourage the timely enactment of the FY 2027 Defense Appropriations Act to ensure continuity in the defense health research programs. We recognize the continuing challenges inherent in advancing appropriations bills through the “regular order” process. However, sustained and predictable investment in this important research is critical to ensure that our nation is prepared for future public health challenges that threaten our current military populations and their families, as well as veterans and the general civilian population. The failure to enact an FY 2025 Defense Appropriations Act led to the devastating 57 percent cut to CDMRP, demonstrating the importance of Congress enacting the Defense bill with full funding for CDMRP. Some of the programs that received no funding or significantly reduced funding in FY 2025 still have not had funding restored to their FY 2024 levels.

We, the undersigned respectfully request your support for increasing the appropriation for CDMRP by at least five percent plus inflation in the FY 2027 Defense Appropriations Act.

Sincerely,

Alliance for Vision Research
